BASIC-ABSTRACT:

The moulding comprises (1) a core component consisting of polyamide with 7×10^{-5} mol/g AEG of terminal amino groups coloured with a 1 : 2 type metal/acetic acid dye and (2) a sheath component consisting of polyamide with 2×10^{-5} mol/g terminal amino groups. The core dye has little tendency to diffuse into the sheath, and hence is colour-fast.

ABSTRACT:

PURPOSE: To obtain the subject fiber excellent in color fastness to light and washing by dyeing sheath-core type conjugate fiber in which a polyamide is arranged in the sheath part and a specific modified polyester is arranged in the core part only with a cationic dye to specific values of the percentage exhaustions in the sheath and core parts.

CONSTITUTION: Sheath-core type conjugate fiber in which a polyamide is arranged in the sheath part and a sulfonated aromatic

dicarboxylic
acid-modified polyester (e.g. sulfoxyisophthalic acid) is
arranged in the core
part at 20-75wt.% conjugate ratio of the polyamide sheath
part is dyed only
with a cationic dye to regulate the dye percentage
exhaustion of the sheath
part to $\leq 10\%$ based on that of the aforementioned core
part and $\leq 0.2\%$ owf.
Thereby, the objective conjugate fiber, excellent in color
fastness to light
and washing and dyed to a bright color is obtained. The
resultant fiber is
suitable as sportswear, outerwear, etc.
